Year 2010 began with the launch of a new offer, Codendi SaaS, which open new opportunities for the Codendi users.

Doing our best to answer your expectations concerning your applications lifecycle management, the Coclico project still goes on with a common development with our partners.

Besides, we have collected the testimony of one of our clients in the medical domain to understand how he is using the platform in his business case.

Our team tries also to give you regularly the latest news about Codendi on the blog. And for more daily information about Codendi, don't hesitate to join the community on the Codendi.org site, if you haven't done it yet.

I wish you a good reading, and a year full of projects!

The new Codendi SaaS offer is launching in 2010.

Up to now, Codendi Pro Services is providing on application support for a Codendi platform hosted and maintained by our clients.

In alternative to Codendi Pro Services, and to keep enterprise involved on its own business without sustaining a server farm, the Codendi SaaS offers a ready-to-use Codendi solution : our team installs, manages and maintains Codendi platform (network and server) hosted in on Xerox site.

This SaaS Offer allows a distant access to Codendi platforms wherever the company sites are, so that users get all benefits from the knowhow and experience of our team in monitoring a robust and reliable network of a large company and in supporting Codendi application.

Codendi SaaS is available from 15 users, for an unlimited project number.

The other advantages of the SaaS offer are :

- cost reduction, because of no installation, maintenance, equipment costs,
- consequently, an ease of budgeting and controlling fixed costs,
- an immediate availability of the application, because of the pre-existing solution on the server, and therefore a fast deployment.

Afterwards, the customers could choose a Codendi Pro Services after having subscribed to Codendi SaaS, if they finally want to integrate their projects on their own server.

More information about SaaS :

SaaS, for "Software as a Service", is an application hosted in an external server from the customer use.

Launched in 2001, this kind of service is more and more provided. The SaaS market size was estimated in 2007 as \$5.1 billion, and the main surveys estimate a 100% increase of the market in 2011.

It happened in January...

- Participation to the INRIA conference cycle about the open-source in the development matters. Codendi and its evolution has been presented.

- Mr. Richard Mathew Stallman was present to the conference in Grenoble, he has explained his open-source software definition.

SORIN adopts Codendi for its medical applications development

SORIN Group is the international company specialized in the treatment of cardiovascular diseases, and regroups 3500 employees in the world, distributed in 3 core businesses: Cardiopulmonary , Cardiac Rhythm Management (CRM) and Heart Valves.

The CRM Division is specialized in the conception of cardiac stimulators and implantable defibrillators intended to regulate the heart rhythm and of systems of recording and analysis Holter used to diagnose the cardiac arrhythmias.

Onto this division, programming and monitoring team is using Codendi for the development of electronical applications dedicated to analyze cardiac activity, monitor extra-corporeal blood circulation for Heart surgery, and to control the electrocardiograms signals to avoid arrhythmia.

To develop these programs, SORIN Group was looking for a software forge which could centralize on site the numerous tools required for software development.

As trackers are strategic for SORIN development activity, the sought application had to integrate complex and highly developed trackers.

Codendi has also been chosen for its workflow, cross referring features, and its collaborative aspect.

And currently, Codendi is used by multidisciplinary teams in different sites in Europe. More than 50 users are relying on Codendi to follow up around 25 projects.

The most used features are trackers, documents and code versioning to check the project progress, as well as chat and Wiki to ease the distant communication.

“Using Codendi has improved the collaborative aspect of our way of working, and allows our projects to be centralized. The projects actors have a better visibility on what the others have done and what they still have to do, which optimize the collaboration of the teams, making it more efficient.” Mr. Dvorak, responsible for programming and monitoring team, confided.

Visit the community site : codendi.org

Codendi.org site has been launched in June 2009, and allows everyone, developer, project manager, or architect, to work from their company or at home, to discover Codendi interface, download the Labs version, communicate with other users, and contribute to the Codendi development.

Indeed, the Codendi visible application on the site is the version used by the development team to improve and develop Codendi. You can then enter the project, have a look to its progress, ask your questions, contribute to the last modifications, and access some parts of the codes through different programming languages.

Since June, around 44.000 download actions have been registered, and 315 users have participated by bug tracking, code contribution or communication in the forum of the Codendi.org site.

Have you visited the site? What is your feedback? You can directly post your comments on the site.

Some news about Coclico

 The Codendi development team is working with CELI, a company specialized in linguistics, data processing optimization and analysis of web content information.

This partnership aims at working on one topic of the Coclico project: the full text search implementation on the different current forges.

Indeed, search tool is one of the required features in such applications. This tool, an open source plug-in, will provide full text search over the documents stored in various Codendi services, as the document manager, the trackers, the mailing lists or the forums.

Discover Codendi 4.0
